

# IRON DOOR COLD CLIMATE DISCLAIMER

Forged iron doors are designed for use in mild and/or moderate climates and the use of forged iron doors is not recommended in cold climate applications. While the door panels and frames are foam injected to provide the best insulating properties available, the doors and frames are not thermally broken. This non-thermally broken design will allow for heat and cold transfer from outside to inside and/or vice versa.

No warranty is offered as to the suitability of using this product in a cold climate. Condensation and frosting is possible and in fact likely to occur when installed in cold climates. Below is a U.S. map with "frost line" as defined by state. States in blue typically have harsher winters and therefore are classified as cold climate states.
